

Vulnerability Assessment Report for a Live Website

CIN: FIT/MAY26/CS8278

Subject: Cyber Security Lab

Website Tested: OWASP Juice Shop Demo Website

1. Objective

To perform a basic vulnerability assessment on a live website using Developer Tools and Nmap in Kali Linux.

2. Tools Used

- Kali Linux
- Mozilla Firefox Developer Tools
- Nmap
- Oracle VirtualBox
- OWASP Juice Shop Demo Website

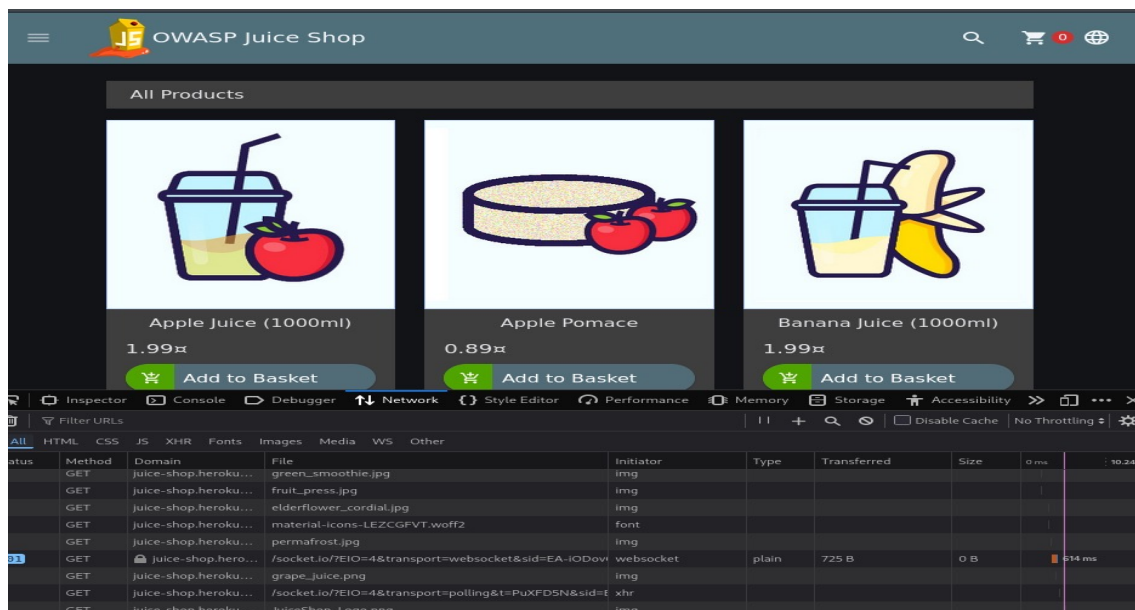

3. Identified Vulnerabilities

Vulnerability	Risk Level	Simple Explanation	Remediation Steps
Server Information Disclosure	Low	The server name and related information were visible in response headers.	Hide unnecessary server information from HTTP headers.
Missing Content Security Policy	Medium	No strong Content Security Policy was identified for restricting scripts.	Configure proper CSP headers to improve security.
Technical Header Exposure	Low	Technical response headers revealed implementation details.	Limit or remove unnecessary response headers.
Potential Information Leakage	Medium	Developer Tools exposed request and response information.	Reduce exposed metadata and apply secure configurations.

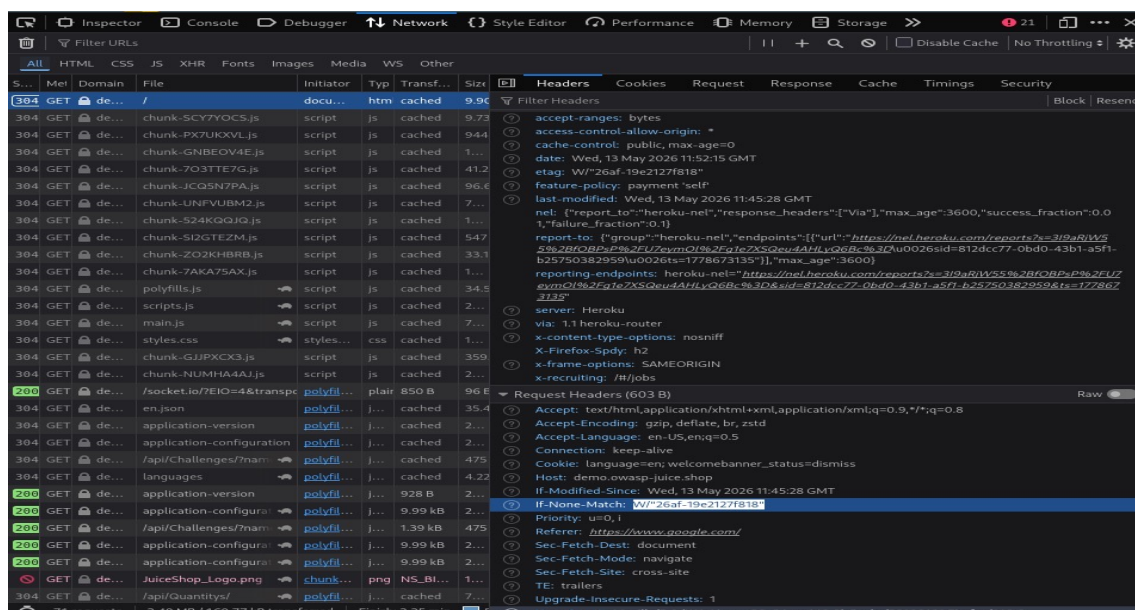

4. Procedure

1. Started Kali Linux in Oracle VirtualBox.
2. Connected the virtual machine to the internet.
3. Opened OWASP Juice Shop demo website in Firefox browser.
4. Opened Developer Tools using the F12 key.
5. Inspected HTTP request and response headers in the Network tab.
6. Executed Nmap scan commands in Kali Linux terminal.

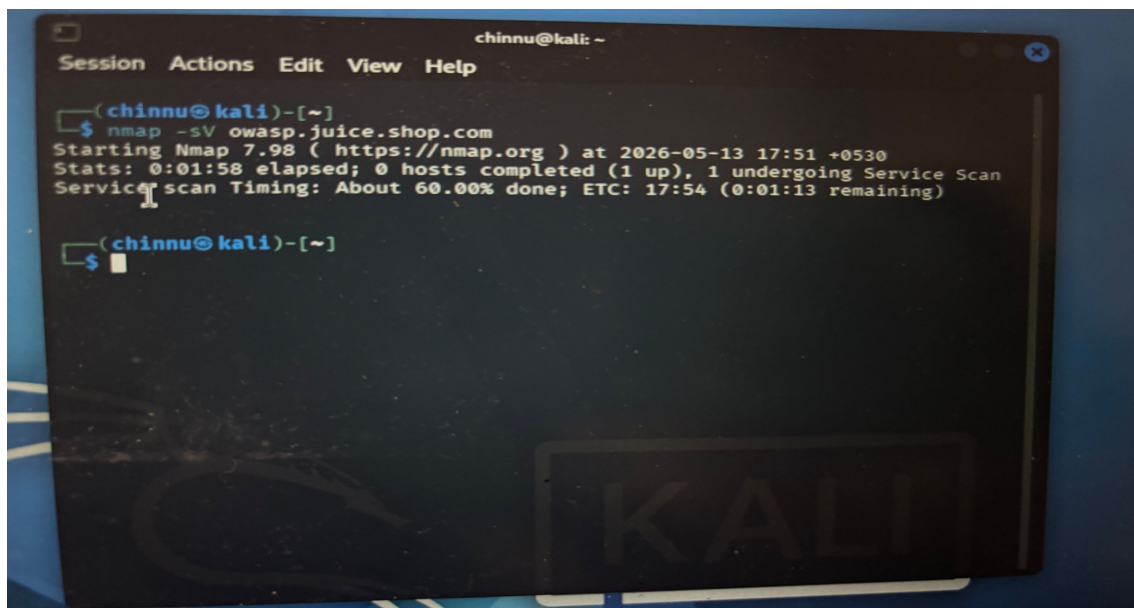

5. Screenshots

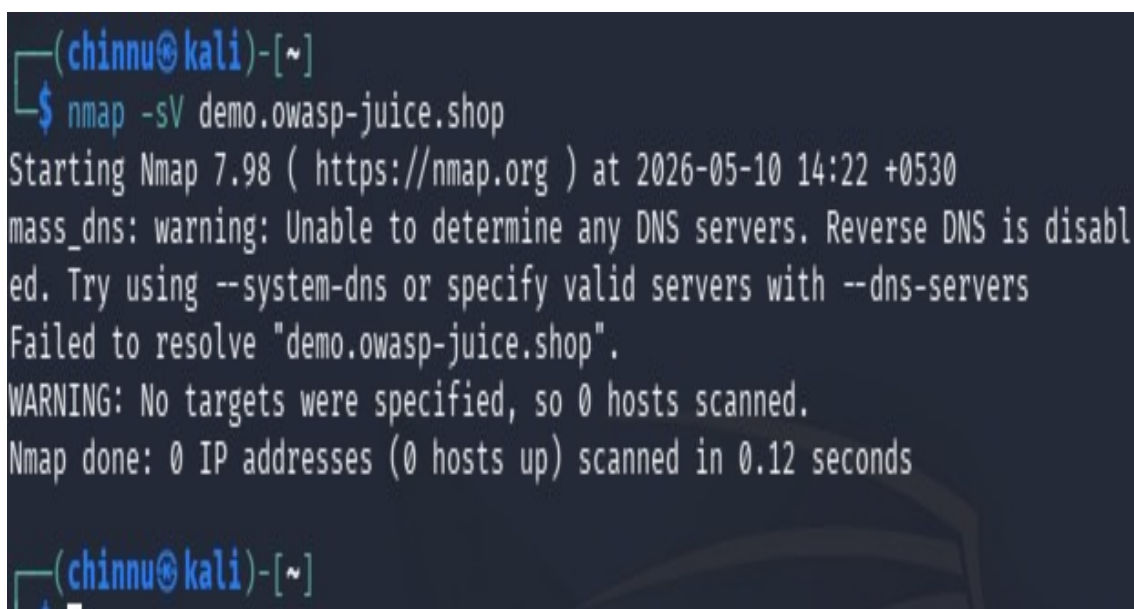

OWASP Juice Shop website with Developer Tools

HTTP response headers and server information

Nmap service version scan in Kali Linux

Initial Nmap scan with DNS resolution warning

6. Conclusion

The vulnerability assessment was successfully performed on the OWASP Juice Shop demo website using Developer Tools and Nmap. The analysis helped identify security-related information such as server headers and basic configuration issues.
